Migration Note: Google Colab to Kaggle Notebooks

To: Course team | **From:** Roey Kadur | **Subject:** Moving the Module 9 course workflow

Decision: Kaggle Notebooks is a workable alternative for running this Python notebook, after a short setup and file check.

What transfers untouched

• **Notebook structure:** The `.ipynb` file and its Markdown/code cells can be uploaded to Kaggle and opened as a notebook.

• **Python code:** Standard Python and common data-science code should transfer without changes. Code that depends on Colab-only helpers (for example, `google.colab.files` or `drive.mount`) must be replaced with Kaggle-compatible file access.

• **Version history copy:** Keep the original notebook in the portfolio repository; upload a working copy to Kaggle so the submitted source remains reviewable.

What needs to be redone

Item	Action on Kaggle
Account and access	Sign in or create a Kaggle account, accept applicable platform terms, and confirm notebook access before the deadline.
Notebook and storage	Upload the `.ipynb`; add input files through Kaggle's notebook data/input workflow or another approved source. Colab Drive mounts and local runtime paths do not carry over.
Packages	Inspect imports, then install missing non-default packages in the Kaggle session (or select an environment that provides them). Record versions for packages that affect results.
Runtime settings	Select an available accelerator only if the work needs it; recheck any hardware-specific assumptions and rerun all cells from the top.
Outputs and links	Regenerate outputs in the new session, save required files to a persistent/downloadable location, and update any Colab-specific links in the notebook.

Risk and mitigation

Risk: A notebook can open successfully while still depending on a file stored only in a Colab session or on a package installed only in that session. The result may fail partway through or produce different outputs after migration.

Mitigation: Keep inputs in a named, documented location; add a setup cell for required packages; record package versions; then restart the Kaggle session and run every cell top to bottom before treating the migration as complete.

Experience from the local Jupyter to Colab move

In Module 1 Lab 2, my notebook loaded `chickwts.csv` with `pd.read_csv("chickwts.csv", index_col=0)`, using a relative file path. That taught me to check the data file location when moving notebooks between platforms: the notebook can transfer while its input file still needs to be added to the new platform and made available at the expected path. In this migration, I would verify that input step before running the analysis.

Portfolio repository

Repo URL: https://github.com/roee0910/cs82a-portfolio.git

Suggested path: `module9/module9_lab2.ipynb`
