

Module 2 Lab 1 — Python Warm-Up + First Push

Name: Roee Kadur
Course: CS 82A
GitHub Repository: <https://github.com/roee0910/cs82a-portfolio>

This notebook completes Steps 1–9 of Module 2 Lab 1.

Step 1: Wages with f-strings

```
In [1]: name = "Roee"
        hourly_wage = 20.0
        hours = 32
        weekly_pay = hourly_wage * hours

        print(f"{name} earns {weekly_pay} per week")
```

Roee earns 640.0 per week

Step 2: Count the warm days

```
In [2]: temps = [61, 65, 72, 58, 70, 74, 68]

        warm_days = 0
        for temp in temps:
            if temp > 65:
                warm_days = warm_days + 1

        print(warm_days)
```

4

Step 3: Temperature converter

```
In [3]: def to_celsius(f):
        return (f - 32) * 5 / 9

        print(round(to_celsius(temps[0]), 1))
```

16.1

Step 4: A movie dictionary

```
In [4]: movie = {
        "title": "The Dark Knight",
        "year": 2008,
        "rating": 9.0
        }

        for key, value in movie.items():
            print(key, ":", value)
```

title : The Dark Knight
year : 2008
rating : 9.0

Step 5: Load and inspect chickwts.csv

```
In [5]: import pandas as pd

        df = pd.read_csv("chickwts.csv", index_col=0)
```

```
df.head()
```

```
Out [5]: <style scoped> .dataframe tbody tr th:only-of-type { vertical-align: middle; }
.dataframe tbody tr th { vertical-align: top; } .dataframe thead th { text-align: right; }
</style> <thead> <th></th> <th>weight</th> <th>feed</th> </thead> <tbody>
<th>1</th> <th>2</th> <th>3</th> <th>4</th> <th>5</th> </tbody> <tbody>
</tbody>
```

```
179  horsebean
```

```
160  horsebean
```

```
136  horsebean
```

```
227  horsebean
```

```
217  horsebean
```

```
In [6]: df.shape
```

```
Out [6]: (71, 2)
```

```
In [7]: df.describe()
```

```
Out [7]: <style scoped> .dataframe tbody tr th:only-of-type { vertical-align: middle; }
.dataframe tbody tr th { vertical-align: top; } .dataframe thead th { text-align: right; }
</style> <thead> <th></th> <th>weight</th> </thead> <tbody> <th>count</th>
<th>mean</th> <th>std</th> <th>min</th> <th>25%</th> <th>50%</th> <th>75%
</th> <th>max</th> </tbody> <tbody></tbody>
```

```
71.000000
```

```
261.309859
```

```
78.073700
```

```
108.000000
```

```
204.500000
```

```
258.000000
```

```
323.500000
```

```
423.000000
```

Step 6: Interpret describe()

The average chick weight is about **261.3**, while the median is **258**, so a typical chick in this dataset weighs around 260. The standard deviation is about **78.1**, showing a fairly wide spread in weights, with values ranging from **108 to 423**. The large range suggests that the chicks vary substantially in size.

Step 7: GitHub repository

Create a **PUBLIC** repository named `cs82a-portfolio`.

README text:

```
<p>Hi, I'm Roee Kadur. This repository is my portfolio for CS 82A,
where I am learning Python and data science foundations.</p>
```

Module 2: Python foundations

Step 8: Upload the notebook

Upload this file to the module2/ folder in the public repository:

module2/module2_lab.ipynb

Step 9: Submit the URL

GitHub repository URL: <https://github.com/roee0910/cs82a-portfolio> Submit module2_lab.ipynb and module2_lab.pdf individually to Canvas.
